

Enter the Building Ready

With **EHR for Practice Groups** designed for senior care practitioners

Before You Enter the Building:

Identify at-risk patients with Predictive Return to Hospital (pRTH) Risk Stratification.

1

Review every patient across every facility in one practitioner-curated view, all with a single login.

Open the full record, not just the most recent note, so you arrive knowing history, medications, and recent changes.

Check which patients are flagged at highest risk of return to hospital so you can decide who to see first.

While You are in the Building:

Focus on patients rather than documentation with AI-powered Ambient Scribe.

See as much as five minutes of time returned per note.² An estimated 15,700 hours of documentation time is saved across one year of AI scribe use.³

2

Start Ambient Scribe at the beginning of the visit so the conversation is captured while you talk.

Stay focused on the patient and let the note draft in the background.

Review the draft before you move to the next room, so nothing waits until the end of the day.

1 in 4

patients discharged to a skilled nursing facility are readmitted within 30 days.

78%

of those readmissions are considered potentially avoidable.¹

Before You Leave the Building:

Ensure complete documentation the first time, every time.

3

Sign your notes for the day while the visits are still fresh.

Confirm your documentation is complete so billing goes out accurately the first time.

“EHR for Practice Groups connects us to the right data, improves our documentation and billing, and ultimately lets us treat patients better because we’re not chasing information anymore.”

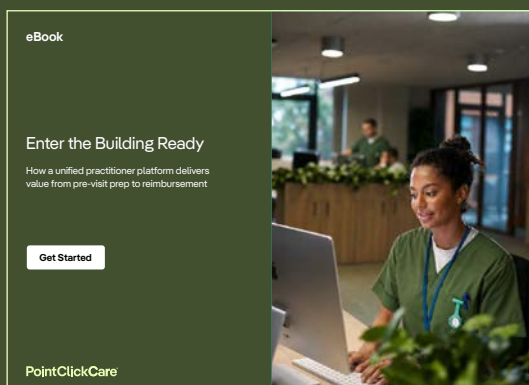

Dr. Rashid Atique, CEO,
Transitional Care Physicians²
